Exterprise website: domain, SEO and AEO launch guide

The site is live at https://xvoxlabs.github.io/Exterprise/ and is already built for **https://www.exterprise.us**. All canonical URLs, the sitemap, share previews and structured data point there. These steps move the domain over and get search engines and AI assistants to pick it up.

---

1. Connect www.exterprise.us through Cloudflare (no downtime)

Hosting: Cloudflare (free plan), using Workers static assets. It deploys automatically from this GitHub repo, so every push goes live in about a minute, just like now.

Settings already in the repo:

- `wrangler.jsonc`: tells Cloudflare to serve every page exactly at its `.html` address.
- `_redirects`: real permanent (301) redirects for addresses without `.html` and common old-site addresses.
- `_headers`: caching (pages always fresh; fonts, libraries and versioned CSS/JS cached for a year; images and video for a week) plus security headers.
- `tools/build.sh`: copies only the public site into `dist/` for each deploy, so `docs/`, `tools/` and config files stay private.

The old site stays live until step 12, and you can undo the switch in about a minute.

Phase A. Preparation (visitors and email see no change)

1. **Back up the old site.**
2. **Write down your current DNS records** at your registrar (GoDaddy, Namecheap and so on). A screenshot or export of the DNS page is enough. The ones that matter most:
   - **MX** records (email)
   - **TXT** records (SPF `v=spf1 …`, DMARC `_dmarc`, domain verifications)
   - any **CNAME** records such as `autodiscover`, `selector1._domainkey` or `mail`
3. **Turn off DNSSEC at your registrar** if it's on. Leaving it on while you change nameservers is the most common cause of a site and email going down. You can turn it back on through Cloudflare later.
4. **Create a Cloudflare account** at dash.cloudflare.com, then **Add a domain** → `exterprise.us` → **Free** plan. Cloudflare scans and copies your existing DNS records.

5. **Check the copied records against your list from step 2**, line by line.
   - Add anything missing, especially **MX** and email **TXT/CNAME** records.
   - Any record for mail (`mail`, `autodiscover`, `_domainkey`, `smtp`) must be **DNS only** (grey cloud).
   - Leave the `@` and `www` records pointing at the old site for now.
6. **Create the hosting:** Workers & Pages → **Create** → **Import a repository** → connect GitHub → choose **XVOXLABS/Exterprise** → branch `main`.
   - Build command: leave empty. The build step is already set in `wrangler.jsonc`.
   - Deploy command: `npx wrangler deploy` (the default).
   - Root directory: `/`.
   - Click **Deploy**.
7. **Test the preview address** Cloudflare gives you (`exterprise.<your-account>.workers.dev`): the homepage, a few sub-pages, a phone, a made-up address like `/contact-us` (should land on Contact), and `/robots.txt`.

Phase B. Move DNS to Cloudflare (still no change for visitors)

8. Cloudflare shows two nameservers, for example `ada.ns.cloudflare.com` and `bob.ns.cloudflare.com`. At your registrar, replace the current nameservers with these two.
9. Wait for Cloudflare to email you that `exterprise.us` is **Active**. This usually takes under an hour, and at most 24 hours. During this time both old and new nameservers answer with the same records, so nothing breaks.
10. **Send yourself a test email** to contact@exterprise.us and reply from it, to confirm mail still works.

Phase C. Go live (about 2 minutes, at a quiet time)

11. In Cloudflare DNS, **note the current `www` and `@` records** (needed if you roll back), then delete them.
12. In your Worker → **Settings → Domains & Routes → Add → Custom domain**, add `www.exterprise.us`, then add `exterprise.us`. Cloudflare creates the records and the HTTPS certificate itself, usually within a minute.
13. Go to **Rules → Redirect Rules → Create rule → template "Redirect from root to WWW"**. This sends `exterprise.us/...` to `https://www.exterprise.us/...` (301, keeping the path).
14. Go to **SSL/TLS** and set the mode to **Full (strict)**. Under **Edge Certificates**, turn on **Always Use HTTPS**.
15. Check https://www.exterprise.us, https://exterprise.us, a sub-page and a phone. Done.

Rolling back: remove the custom domains from the Worker and re-add the records you noted in step 11. The old site is back within a minute or two.

Phase D. Extras on the same free plan (optional, recommended)

- **Speed:** Speed → Optimization → turn on **Early Hints**. HTTP/3 is on by default.
- **AI scrapers:** Security → Bots → turn on **Block AI Scrapers and Crawlers** only if you want hard blocking.

- This also stops AI assistants reading your pages, which works against AEO.
- The softer option, already in place, is `robots.txt`: assistants may read pages but not media.
- A middle ground is **Bot Fight Mode**: it blocks bad bots and lets verified ones (Google, Bing, ChatGPT, Claude) through.
- **Analytics:** Analytics & Logs → **Web Analytics**. It's free and needs no cookie banner.
- **GitHub Pages:** keep it as a backup copy. Every page points Google to www.exterprise.us as the main address, so the copy doesn't hurt rankings. Or turn it off in GitHub Settings → Pages once Cloudflare has run smoothly for a few weeks.

Why not Vercel?

Vercel is fast and easy, but its free (Hobby) plan is for **non-commercial use only**. A company website needs Vercel **Pro at $20 per member per month**, and bot blocking is more limited.

	Cloudflare (free)	Vercel Pro ($20/member/mo)	GitHub Pages (free)
Commercial use	Yes	Yes	Yes
Speed	Excellent	Excellent	Good
Bandwidth	Unlimited for static files	1 TB/month included	Soft limit of 100 GB/month
Real 301 redirects and headers	Yes	Yes	No
Bot/AI-scraper blocking	Yes, built in	Limited	No
Deploys from GitHub	Yes	Yes	Yes

For a static site like this one, Cloudflare gives the same or better speed for free. Netlify is similar to Vercel; its free tier allows commercial use, but bandwidth is capped.

---

2. Search engines (day 1, after the domain works)

1. **Google Search Console** (search.google.com/search-console)
    1. Add a **Domain** property for `exterprise.us` and verify it with the DNS TXT record Google gives you.
    2. Submit `https://www.exterprise.us/sitemap.xml` under **Sitemaps**.
    3. Use **URL Inspection** to request indexing for the homepage, servicenow.html, smartsourcing.html and it-service-management.html.
2. **Bing Webmaster Tools** (bing.com/webmasters): sign in and choose **Import from Google Search Console**. Bing also powers ChatGPT search and Copilot, so this step matters for AI answers too.
3. **Google Business Profile**: create or claim **Exterprise, Dallas TX** with the website `https://www.exterprise.us`, the category **Software company** / **Business management consultant**, and the same description as the About page.

4. **Check the structured data**: run https://search.google.com/test/rich-results and https://validator.schema.org on the homepage and on servicenow.html. You should see Organization, Breadcrumb, Service and FAQ.

---

3. What's already built into the site

On every page

- A keyword-focused `<title>` and description, set in `tools/meta.py`.
- A canonical URL and robots tag.
- Open Graph and Twitter tags for share previews, using the image `assets/og-cover.jpg`.

Structured data (JSON-LD) on every page

- Organization: name, legal name, founded 2015, Dallas HQ, the three delivery centers, email, LinkedIn and areas of expertise.
- WebSite, WebPage and BreadcrumbList.
- Service, on all 39 service pages.
- FAQPage, on the 7 pages with an FAQ section.

Site files

- **FAQ sections** (`tools/faq.py`) on the homepage, ServiceNow, ITSM, AI Agents & Now Assist, Smartsourcing, Contact Center and Revenue Cycle pages. Every answer leads with the direct answer, and every fact also appears elsewhere on the site.
- **`sitemap.xml`**: lists all 42 pages.
- **`robots.txt`**:
- Search engines and link-preview bots can access everything.
- AI assistants (GPTBot, ClaudeBot, PerplexityBot, Google-Extended and others) can read every page, but not `/assets/`, `/fonts/`, `/vendor/` or the CSS and JS files.
- Unknown bots get the same rules.
- **`llms.txt`**: a short, structured guide to the company and every page, for AI assistants.
- **`llms-full.txt`**: the text of every page in one file, so assistants quote you accurately.
- **`agents.md`**: a note to AI agents covering what they may do (read, summarize and cite with a link) and what they may not do (reuse images, video, fonts or code; auto-submit the contact form). It also lists the key facts.
- **`404.html`**: forwards old URLs to the right new page and is not indexed.

After you edit page content

```
python3 tools/meta.py && python3 tools/faq.py && python3 tools/seo.py && python3 tools/stamp-assets.py
```

---

4. Ranking higher and getting recommended by ChatGPT, Claude, Gemini and Perplexity

No one can guarantee the #1 spot or an AI recommendation. These are the levers that actually move it, in order of impact.

1. **Be mentioned elsewhere.** AI assistants recommend companies that other trusted sites talk about.
   - Get Exterprise listed in the **ServiceNow Partner Finder** with a complete profile and case studies.
   - Ask clients for reviews on **G2** and **Clutch** (Clutch's "ServiceNow consultants" category ranks well).
   - Keep the **LinkedIn company page** in step with the site: same description, Premier Partner badge and locations.
   - Get listed in industry directories for BPO, healthcare RCM and contact centers.
2. **Publish proof.** One case study per main service, each with the client industry, the problem, what you did and the numbers (for example "99.99% SLA adherence over 24 months").
   - These are the pages AI assistants cite.
   - I can add a Case Studies page and template whenever you have the material.
3. **Answer the questions buyers ask.**
   - Add an FAQ to more service pages. Copy the pattern in `tools/faq.py`.
   - Write short guides, such as "How long does a ServiceNow ITSM implementation take?" and "Onshore vs near-shore vs offshore contact center costs".
4. **Use the same words everywhere.** Write "ServiceNow Premier Partner for Consulting & Implementation" and "Smartsourcing (business process outsourcing)" identically on the site, LinkedIn, the ServiceNow profile and directories. Consistency is how AI models learn what you are.
5. **Keep it fresh.** Post an update or case study every month, and re-run `tools/seo.py` so the sitemap dates change.
6. **Watch the numbers.**
   - Search Console: queries such as "ServiceNow implementation partner" and "ServiceNow ITSM partner Dallas".
   - Once a month, ask ChatGPT, Claude, Gemini and Perplexity "Who are good ServiceNow implementation partners in Dallas?" and note whether Exterprise appears.

Target keywords already used in titles and descriptions

Area	Keywords
ServiceNow	ServiceNow implementation partner, ServiceNow consulting partner, ServiceNow Premier Partner, ServiceNow ITSM / ITOM / CSM / HRSD / FSM / SPM / GRC implementation, Now Assist implementation, ServiceNow AI Agents, AI Control Tower, CMDB / CSDM, App Engine
Outsourcing	business process outsourcing (BPO), contact center outsourcing, healthcare revenue cycle management, medical claims processing, records digitization, county records conversion, property preservation services, data capture and data entry
Technology	custom AI solutions, AI image analytics, Snowflake data management, SAP implementation, application development, UX/UI design, digital marketing
Location	Dallas TX, India (Chennai, Coimbatore), near-shore Honduras (San Pedro Sula)
